

## **Red Racer**

- **new workshop trolley from KS Tools**
- **a great look, even better content**
- **practical equipment**

When you look for a workshop trolley, first of all you need a practical assistant for everyday work at the workshop. When the trolley also looks cool, it becomes an all-round crowd pleaser. KS Tools have a new red workshop trolley in the pipeline, which meets both requirements perfectly. Look no more: here we already have it with seven drawers filled with a 215 piece tool set ready for a real professional. The new RACINGline workshop trolley is already available for only EUR 499. This attractive price is a thank you from KS Tools on its 25th birthday to its customers. The offer is valid until 1 April while the stocks last. The workshop trolley comes under the number 826.7215 at KS Tools.

The tools included offer an ideal selection for universal usage. They are stored securely in the drawers as they are safely embedded with no clattering, while each tool is immediately on hand when needed. Four large rollers make it particularly stable yet mobile, as two of them are castors.

Its seven drawers can be pulled out completely with their ball bearing-based drawer guide, so that you can always enjoy a full view of your tools. Each drawer can be locked individually to prevent unintended opening, while there is also a central locking system to secure the entire valuable contents of the trolley for those moments when you have to leave it unattended.

The trolley is manufactured out of stable, 0.9 mm electrostatically powder-coated steel plate. There is a rectangular opening on each side so that it is child's play to attach it to the wall. A worktop made out of stable ABS plastic provides a sturdy work surface. It is also equipped with small compartments, so that screws, nuts and other small parts can be stowed safely during work yet within easy reach.

The edges and corners of the RACINGline KS Tools workshop trolley are protected with polyurethane. This will minimise the possibility of damage to the trolley as well as preventing injury from hard edges. Also, the trolley can be safely steered into position with a metal handle on the side.
